The present sequence represents an antigenic peptide from human telomerase reverse transcriptase (HTRT), from the present invention. The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polymucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of recombinant telomerase by contacting a protein preparation of recombinant telomerase by contacting a protein preparation of the hTRT NNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of NNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (B) the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibiting ageing . A protein preparation of hTRT and the polymucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the profuse of ageing or cancer. Inhibitors of telomerase activity can be effect of ageing or cancer. Inhibitors of telomerase activity can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; telomerase catalytic subunit; hTERT; human leukocyte antigen; human telomerase reverse transcriptase; HLA epitope; cancer; HLA profile; breast cancer; pancreatic cancer; colorectal cancer; lung cancer; ovarian cancer; cervical cancer; malignant melanoma; leukaemia; lymphoma; biliary tract carcinoma; anti-cancer; mutant; cytostatic; HLA class I epitope; HLA class II epitope; mutein.

The present invention relates to a polypeptide comprising a 20 amino acid sequence derived from human telomerase catalytic subunit con human telomerase reverse transcriptase, hTERT) amino acid sequence for human telomerase reverse transcriptase, hTERT) amino acid sand at least two human leukocyte antigen (HLA) class I or class II captopes. The invention also describes a polypeptide having the above contained and peptide sequence as additional C and/or N-terminal sequences on a fragment of hTERT which is not more than 100 amino acids of hTERT. The polypeptides of the invention are useful in a acids of hTERT composition or in a vaccine for preventing or treating cancer in populations of individuals having varying HLA profiles. The polypeptides of the invention are useful in a cancers such as breast, pancreatic, colorectal, lung, ovarian or cancers such as breast, pancreatic, colorectal, lung, ovarian or cervical cancer, malignant melanoma, leukaemia, lymphoma or biliary tract carcinoma. The polypeptides or encoding polymuclectide sequences are useful for performing identity, sequence homology and/or hybridisation studies, for predicting structure and/or function (e.g. anti-cancer activity), or for screening methods in the present a hTERT fragment with the 20 amino acid HLA epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New catalytic protein of telomerase of a higher animal and a gene coding it - useful for diagnosis of diseases caused by the change in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                 New polypeptide with an additional C-terminal and/or N-terminal sequence, useful for preparing anti-cancer vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Catalytic telomerase; diagnosis; disease; telomerase activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel human CRT-1 genes and their encoded proteins containing a reverse transcriptase motif, which act as telomerase inhibitors. The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer cells, and to screen telomerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel gene, useful in detection of telomerase activity and cancer cells as well as screening telomerase inhibitors for treatment of

The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer cells, and to screen telomerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel human CRT-1 genes and their encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel gene, useful in detection of telomerase activity and cancer cells as well as screening telomerase inhibitors for treatment of
                                                               The specification describes a human catalytic telomerase protein. The products are useful in drug compositions for the diagnosis of diseases caused by the change in activity of telomerase. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CRT-1; reverse transcriptase; telomerase; inhibitor; detection; telomerase activity; cancer cell; screening; human.

This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used to diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, cother skin growths. Enhancers of telomerase may be used to stimulate stem or skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the born marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following injury.

Note: The N-terminus of this sequence can be replaced by the sequences shown in AAYO0656-Y00658.
                                         Telomerase; human; cancer; diagnosis; melanoma; skin cancer; leukaemia; euroblastoma; breast carciinoma; colon carciinoma; orgeosarcoma; smooth muscle cell hyperplasia; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated vertebrate telomerase genes - used to develop products for treating cancers or for organ regeneration, nerve cell or brain cell growth following injury or bone marrow transplantation
N-terminal truncated telomerase (ver. 2) protein sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 146; DB 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, lymphomas, osteosarcomas or smooth muscle cell hyperplasias or skin growths. Enhancers of telomerase may be used to stimulate stem cells proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      well, many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following injury.
                                                                                                                                    Telomerase; human; cancer; diagnosis; melanoma; skin cancer; leukaemia; neuroblastoma; breast carcinoma; colon carcinoma; lymphoma; osteosarcoma; smooth muscle cell hyperplasia; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated vertebrate telomerase genes - used to develop products for treating cancers or for organ regeneration, nerve cell or brain cell growth following injury or bone marrow transplantation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The present sequence represents a human telomerase reverse transcriptase
                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                          This invention describes novel human CRT-1 genes and their encoded proteins containing a reverse transcriptase motif, which act as telomerase inhibitors. The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer cells, and to screen telomerase inhibitors. The detection method is simple and effective.
                                 Novel gene, useful in detection of telomerase activity and cancer cells as well as screening telomerase inhibitors for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  prognosis; cell proliferation; cancer; ageing; ribonucleoprotein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pure and recombinant human Telomerase Reverse Transcriptase and variants - are useful in the diagnosis, prognosis and treatment cell proliferation conditions especially cancer and ageing

describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein of preparation of hTRT with a telomerase RNA component; (C) detection of the hTRT with a telomerase RNA component; (C) detection of the hTRT with a telomerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of intro a sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT expression; and (B) the use of an agent that causes an increase in cell correlation proparation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the used to treat conditions that are associated with high telomerase used in the new activity. A protein preparation of hTRT can also be used in the new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Telomerase; human; cancer; diagnosis; melanoma; skin cancer; leukaemia; neuroblastoma; breast carctinoma; routorcarcinoma; ostrosarcoma; smooth muscle cell hyperplasis; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation.

ö
          This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosing cancer accenting. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, leukaemias, lymphomas, osteosarcomas or smooth muscle cell hyperplasias or skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Telomerase; human, cancer; diagnosis; melanoma; skin cancer; leukaemia; neuroblastoma; breast carcinoma; colon carcinoma; lymphoma; osteosarcoma; smooth muscle cell hyperplasia; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can

                                                                                                                                             cells could be administered in the bone marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neuroblastoma; breast carcinoma; colon carcinoma; lymphoma; osteosarcoma; smooth muscle cell hyperplasia; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation.
                                    leukaemias, lymphomas, osteosarcomas or smooth muscle cell hyperplasias or skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, leukaemias, lymphomas, osteosarcomas or smooth muscle cell hyperplasias or skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Telomerase, human; cancer; diagnosis; melanoma; skin cancer; leukaemia;

Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosins and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, other skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Telomerase; human; cancer; diagnosis; melanoma; skin cancer; leukaemia; neuroblastoma; breast carcinoma; colon carcinoma; lymphoma; osteosarcoma; smooth muscle cell hyperplasia; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation.
cells could be administered in the bone marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following injury. Note: The N-terminus of this sequence can be replaced by the sequences
                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated vertebrate telomerase genes - used to develop products for treating cancers or for organ regeneration, nerve cell or brain cell growth following injury or bone marrow transplantation
                                                                                                                                                                                                                    .

-!- FUNCTION: TELOMERASE IS A RIBONUCLEOPROTEIN ENZYME ESSENTIAL FOR THE REPLICATION OF CHROMOSOME TERMINI IN MOST BURARYOTES. IT ELONGATES TELOMERES. IT IS A REVERSE TRANSCRIPTASE THAT ADDS SIMPLE SEQUENCE MITHIN THE RNA COMPONENT OF THE ENZYME.

-!- SUBGINIT: Interacts with PINXI.

-!- SUBCELLULAR LOCATION: NUCLear.

-!- DISEASE: ACTIVATION OF TELOMERASE HAS BEEN IMPLICATED IN CELL IMMORTALIZATION AND CANCER CELL PATHOGENESIS.

-!- SIMILARITY: BELONGS TO THE REVERSE TRANSCRIPTASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nakamura T.M., Morin G.B., Chapman K.B., Weinrich S.L., Andrews W.H., Lingner J., Harley C.B., Cech T.R.; "Telomerase catalytic subunit homologs from fission yeast and human."; Science 277:955-959(1997).

                                                                                                                                                                                                                                           NATURE 415:871-880 (2002).
-!- FUNCTION: TELOMERASE IS A RIBONUCLEOPROTEIN ENZYME ESSENTIAL FOR THE REPLICATION OF CHROMOSOME TERMINI IN MOST EUKARYOTES. IT ELONGATES TELOMERES. IT IS A REVERSE TRANSCRIPTASE THAT ADDS SIMPLE SEQUENCE REPEATS TO CHROMOSOME ENDS BY COPYING A TEMPLATE SEQUENCE WITHIN THE RNA COMPONENT OF THE ENZYME.

"Kallistatin: a novel human tissue kallikrein inhibitor.
"Kallistation. characterization, and reactive center sequence.";
J. Biol. Chem. 267:25873-25880(1992).
-!- FUNCTION: INHIBITS HUMAN AMIDOLYTIC AND KININGGENASE ACTIVITIES OF HUMAN TISSUE KALLIKREIN. INHIBITION IS ACHIEVED BY PORMATION OF AN EQUINOLAR, HEAT- AND SDS-STABLE COMPLEX BETWEEN THE INHIBITOR AND THE ENZYME, AND GENERALION OF A SMALL C-TERMINAL FRAGMENT OF THE INHIBITOR DUE TO CLEAVAGE AT THE REACTIVE SITE BY TISSUE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- SUBUNIT: MONOMER AND SOME HOMODIMERS.
-!- SUBCELLULAR LOCATION: Secreted.
-!- STSUB SPECIPICITY: Synthesized by liver and secreted in plasma.
-!- PTM: THE N-TERMINUS IS BLOCKED.
-!- PTM: THE N-TERMINUS IS BLOCKED.
-!- MISCELLANEOUS: HEPARIN BLOCK KALLISTATIN'S COMPLEX FORMATION WITH
TISSUE KALLIKREIN AND ABOLISHES ITS INHIBITORY EFFECT ON TISSUE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Serpin; Serine protease inhibitor; Plasma; Glycoprotein; Signal. I. Biol. Chem. 277:46676-46686 (2002).

I. FUNCTION: Mobilizes stored copper from the vacuole to the cytoplasm under conditions of copper limitation.

I. SUBGINIT: Homotrimer.

I. SUBCELLIULAR LOCATION: Integral membrane protein. Vacuolar.

INDUCTION: By copper deprivation.

SIMILARITY: BELONGS TO THE SLC31A FAMILY OF TRANSPORTERS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION, SUBUNIT, SUBCELLULAR LOCATION, AND INDUCTION

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           synthetase 3 gene.";

Gene 278:185-192(2001).

-!- FUNCTION: ACTIVATION OF LONG-CHAIN FATTY ACIDS FOR BOTH SYNTHESIS

OF CELLULAR LIPPIDS, AND DEGRADATION VIA BETA-OXIDATION.

PREFERENTIALLY USES MYRISTATE, LAURATE, ARACHIDONATE AND ERCARPENTARNOATE AS SUBSTRATES (BY SIMILARITY).

-!- CATALYIC ACTIVITY: A long-chain carboxylic acid + CoA = AMP + diphosphate + an acyl-coA.

-!- COFACTOR: MAGNESIUM (BY SIMILARITY).

-!- COFACTOR: MAGNESIUM (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: MICROSOMES, OUTER MITOCHONDRIAL MEMBRANE

AND PEROXISOMAL MEMBRANA.

-!- SIMILARITY: BELONGS TO THE ATP-DEPENDENT AMP-BINDING ENZYME
                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE=97321062; PubMed=9177793; Minekura H., Fujino T., Endo Y., Yamamoto T.T.; Minekura H., Fujino T., Kang M.-J., Fujita T., Endo Y., Yamamoto T.T.; "Human acyl-coenzyme A synthetase 3 cDNA and localization of its gene (ACS3) to chromosome band 2q34-q35.";

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence represents an antigenic peptide from human telomerase reverse transcriptase (hTRT), from the present invention. The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase NNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of NNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing the proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the used to treat conditions that are associated with high telomerase crivity. A protein preparation of hTRT can also be used in the new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Telomerase; antigenic peptide; cancer; therapy; human; tumour cell; malignant melanoma; leukaemia; lymphoma; biliary tract carcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                The present sequence represents an antigenic peptide from human telomerase reverse transcriptase (HTRT), from the present invention. The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase RNA component; (C) detection, amplifying the complex formed or in the case of RNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (B) increasing the product with presence of hTRT in the sample; and (B) increasing the proliferation of a vertebrate cell by increasing hTRT can be used in the use of an agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding hTRT can be used in the manufacture of medicaments for inhibiting the cleffect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

especially, breast, lung, ovarian, cervical, colorectal, prostate or parcreatized cancers, malignant melanoma, leukaemias, lymphomas, or biliary tract carcinomas. They are useful for generating telomerase Tlymphocytes capable of recognising and destroying tumour cells in a mammal, comprising culturing Tlymphocytes obtained from the mammal with the peptides. Telomerase protein is expressed only by tumour cells hence, other body cells are not targeted or destroyed by telomerase specific T
                                                                                                                        Protein or peptide fragments useful in the treatment and prophylaxis of cancer in mammals -
                                                                                                                                                                                                                                                                                                                                                                   cells.

```
The present invention relates to a polypeptide comprising a 20 amino acid sequence derived from human telomerase catalytic subunit for human telomerase reverse transcriptase, hTERT) amino acid sequence for human telomerase reverse transcriptase, hTERT) amino acids and at least two human leukocyte antigen (HiA) class I or class II or class II or amino acid peptide sequence as additional C- and/or N-terminal sequences on a fragment of hTERT which is not more than 100 amino acid peptide sequence as additional C- and/or N-terminal sequences on a fragment of hTERT which is not more than 100 amino acids of hTERT. The polypeptides of the invention are useful in a cancer in population or in a vaccine for preventing or treating cancers such as breast, pancreatic, colorectal, lung, ovarian or carcical cancer, malignant melanoma, leukaemia, lymphoma or biliary tract carcinoma. The polypeptides or encoding polymclectide cancer in a polypeptides or encoding polymclectide sequence are useful for performing identity, sequence homology and/or hybridisation studies, for predicting structure and/or function (e.g. anti-cancer activity), or for screening methods in the sequence as hTERT fragment with the 20 amino acid HLA epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New catalytic protein of telomerase of a higher animal and a gene coding it - useful for diagnosis of diseases caused by the change in activity of a telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a human catalytic telomerase protein. The products are useful in drug compositions for the diagnosis of diseases caused by the change in activity of telomerase. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Catalytic telomerase; diagnosis; disease; telomerase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 100;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Indels
sequence, useful for preparing anti-cancer vaccines

```
This sequence represents the human telomerase reverse transcriptase (hTERT). The invention relates to a monoclonal antibody recognising the hTERT. The antibody can be used for the investigation, diagnosis and treatment of telomerase-related diseases, especially diseases in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New monoclonal antibody recognizing human telomerase catalytic subunit (HTERT) useful for treating and diagnosing cancer
hTRT can be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be used to treat conditions that are associated with high telomerase activity. A protein preparation of HTRT can also be used in the new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human telomerase reverse transcriptase; hTERT; antibody; diagnosis; telomerase-related disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 283;
                                                                                                                                                               Length 259;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઢ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a human telomerase reverse transcriptase (hTRT) protein from a cDNA clone from the present invention. The present invention also describes the following methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase BNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, amplifying the product and correlating the presence of complex (D) increasing the product with presence of hTRT in the sample; and (D) increasing the proliferation of a vertebrate cell by increasing hTRT ceasing the proliferation to agent that causes an increase in cell vertebrate cell proliferation to create a medicament that inhibits ageing. A protein preparation of hTRT and the polynucleotide encoding
                                                                                                                       ·.

The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer cells, and to screen telomerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human telomerase reverse transcriptase 63 kDa clone 712562 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proteins containing a reverse transcriptase motif, which act as telomerase inhibitors. The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer calls, and to screen telomerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel human CRT-1 genes and their encoded
